

COVID the Science Summary: Bruce 9/3/2020

Here is a summary of some of the many data issues that can be openly researched to their sources. Primary sources are the CDC/NCHS, the Johns Hopkins COVID “Sick Map”, and Reuters news service.

1. Compare death rates from COVID per 100,000 population, this level’s the population size factor of big states vs small states making comparisons across populations more realistic. Democrat run States have COVID death RATES much higher, often 2-3 times or more higher than Republican States. A REAL Disease does NOT discriminate by party!
2. **The CDC on 8/26/2020 released an analysis of Death data from COVID and found that COVID alone accounted for ONLY 6% of all reported COVID deaths, in 94% of cases they identified pre-existing conditions which are co-morbidities and those are critical to the death of the patient, they focused on 2.6 cases of comorbidity per person on average. Those include lung disease, diabetes, obesity, heart problems, neurological issues etc. What this means is that instead of 180,000 deaths from COVID ALONE the real number is more like 10,000!**
3. Death rates for COVID in the USA started at about 14%, then 12% and now show about 3% depending on the population’s age, **the reality is that ALL COVID deaths are about 6% OF 3%.**
4. What has stood out through this phony pandemic is that children get COVID, but their deaths are extremely rare (a few dozen in the whole country). This is simply because they are young and generally do NOT have comorbidities, until they are much older, again, indicating that the underlying conditions, but not just age, ARE the primary cause of deaths!
5. Reuters shows “cumulative deaths and infection rates” in their charts. This is dishonest, because a cumulative chart of any kind ALWAYS goes up until there are Zero cases, then it stops. This continues until a disease is permanently eradicated, which in reality never happens.
6. NATIONWIDE rates of infection and deaths peaked in MAY in the USA with a minor rise in July and have fallen since then, the big picture is far more important than local effects.

7. Population immunity is achieved when a certain percentage of the population have had the disease, and survived. That interaction with an individual modifies and mutates ANY disease, but on average reduces its actual population lethality with some rare exceptions.
8. COVID as a virus is part of the Coronavirus family which includes the common cold virus's, and *it is not even a flu virus*. China released this virus and their state Communist Party are the primary sponsors of the WHO that are recommending mitigation steps for the USA. All “medical news” associated with COVID comes from the WHO and is spread through a handful of news networks.
9. The wide variety of symptoms reported are an artifact of the underlying medical condition of the patient, thus people with compromised lungs have trouble breathing, others have different symptoms but they are ALL based on their underlying medical problems.
10. Many hundreds of thousands of Americans die each year from other diseases, and deaths from COVID are a fraction of a fraction of those numbers, in other words, COVID has been embedded in the overall death rates AND **made to LOOK like it is a pandemic.**
11. The use of isolation and masks provides no protection from a virus. No mask made can stop the travel of a virus embedded in a bacterium. Physical isolation also reduces disease resistance, both are currently being used nationwide in a political attempt to disrupt America and create an economic depression rather than cure a minor disease.
